

*Fig. S1.* Flexural pellagroid dermatitis. Pathology. Microscopic section showing acanthosis, small follicular plugs, and compact hyperkeratosis. Higher magnification (*insert*) clearly demonstrates checkerboard pattern of alternating parakeratosis and orthokeratosis (*arrow*). Mild lymphocytic infiltrates are present in the upper dermis. Haematoxylin and eosin; original magnification  $\times 40$  and  $\times 100$  (*insert*).
